

## World-class Casino Relies on 2N Access Control

### Mission

Located in the heart of Riga, Latvia, a new casino grew up. In order to secure the casino, a reliable access control system had to be installed. It had to cover entrances and create security zones within the establishment. Tracking an attendance of employees, user-friendliness and IP background of the system were a must. As a result, an integrator and our partner DTG chose an access control from 2N.

*“We like to work with 2N, because their products and solutions are reliable and the management software is easy to operate. The fact that 2N can be integrated into Milestone and works with AXIS, is a real advantage for clients who think about such solution.”*

**Janis Lizanders, Sales Director, DTG**

### Benefits

- Scalable IP access control system
- Possibility of simple integration with VMSs
- Expandable modular intercom
- Ease of administration, configuration and installation

## Solution

A modular intercom 2N® IP Verso with RFID card reader was installed by every entrance. Calls from the entrance, video from the intercom included, are routed to 2N® Indoor Touch at a reception desk. A receptionist can open doors for guests via this answering unit. For security purposes, it is also interconnected with Grandstream phones installed by cash registers. 2N® Access Units RFID were implemented in order to prevent people from an access to management premises.

The whole IP-based access control system including time attendance is managed through 2N® Access Commander software. The Time & Attendance system is its native part. It records employees' arrivals and departures, which can be viewed via the web interface, integrated with an accounting software for wages calculation or exported to XLS or CSV file. 2N access control system can be easily integrated with Milestone VMS, which is used within the casino.

## Installation

## Result

The 2N access control system implemented in the casino is reliable and easy to administrate. The client particularly values design of 2N devices, user-friendliness and scalability of the system. Due to 2N® IP Verso modularity, additional access technologies can be added, e.g. Bluetooth module, Fingerprint reader module or Touch Keypad module. Besides, the 2N system is open to integration with third-party systems such as Milestone VMS.

## Our customer

A renowned company running entertainment and gaming facilities all over the world with the Latvian casino being one of its flagships.
